

GNED 10 Midterm Reviewer

IV. Gender and Work

- **Gender Gaps:** The IMF notes that gender inequality in the labor market causes economic losses due to the misallocation of women's labor. In the Philippines, women are more likely to hold lower-quality or vulnerable employment. Furthermore, women's heavy responsibility for unpaid domestic work limits their ability to engage in paid work on the same terms as men.
- **Sex-Typing:** This is the belief that men and women are suited for specific jobs based on biological sex. For example, engineering and mechanics are seen as "masculine," while teaching and nursing are "feminine." Parents strongly impact early sex-typing.
- **Discrimination:**
 - *Access Discrimination:* Difficulty getting hired in a particular field based on sex (e.g., fewer women in judicial roles).
 - *Treatment Discrimination:* When a woman earns less (pay gap) or receives fewer promotion opportunities than a male co-worker despite having the same qualifications and performance.
- **Pregnancy:** Mothers face the "mommy tax" or maternal wall. Pregnant women are often stereotyped as delicate, overly emotional, or pitied. Their commitment is questioned, and companies often view maternity as an expense.
- **Work-Family Balance:** Bridging the gender gap in the workplace requires equal pay, eliminating discrimination, and promoting work-family balance. This includes recognizing that women do the bulk of unpaid household work and providing adequate maternity protection and paid parenting leaves.

V. Gender and School

- **Gender Socialization:** The family and the school are the two main pillars of socialization. Gender socialization is the process through which individuals learn to behave, feel, and think according to the forms deemed appropriate for their sex by society. Schools often unintentionally reinforce traditional stereotypes.

- **Gender-Responsive Education:** Schools should deliberately build proper gender education to benefit society. Educators committed to egalitarianism should promote cross-gender interaction, expose pupils to counter-stereotypic models, and teach challenges to gender harassment.
- **Teacher Bias:** Teachers interact with boys 10 to 30 percent more often. They also tend to use "public talk" (talking from a distance) with boys and "private talk" with girls. Furthermore, teachers tend to praise boys for correct knowledge while overlooking their wrong answers, and criticize girls for incorrect answers while overlooking their right ones.
- **School Policies:** Educational policymakers should resist creating gender-segregated contexts (like single-sex schools) and instead enhance co-educational schools' promotion of egalitarian attitudes. Teachers also need explicit policy-backed training to recognize and confront their own explicit and implicit biases.

VI. Gender and the Media

(Note: The provided source document cut off at the beginning of this module, so these points are summarized based on the available text and standard sociological concepts aligned with the module's themes).

- **Media Representation:** Gender equality is a prerequisite for human rights, democracy, and social justice. Media and editorial freedom, alongside media pluralism, are essential for ensuring fair and equal representation of all genders in society.
- **Gender Stereotypes:** Stereotypes are oversimplified and unfair beliefs that all people in a group are the same. Young children internalize these early, which harms their self-images. Breaking the cycle requires rejecting chauvinist attitudes, teaching equality at a young age, and reflecting on ingrained cultural expectations.
- **Advertising:** Media and advertising are primary sources of gender norms. Advertising often perpetuates gender stereotypes by marketing specific behaviors, colors (e.g., pink vs. blue), and roles (e.g., domestic roles for women, analytical roles for men) directly to children and adults, reinforcing societal expectations.
